Ahmad Mollaei

Software engineer | Open to backend-focused roles

contact@ahmadmollaei.dev | ahmadmollaei.dev | github.com/lonlydwolf

Benid-Alghar, KW | +965 95544145

University of Tabriz Computer Science graduate who took a long road back to software through freight forwarding, logistics and automotive diagnostics, automating the tedious parts of every role. Now building developer tools and AI-assisted learning tools while deepening backend and systems foundations.

Current work

Faculty | AI skills | Personal-use beta — Aug 2026

Seven AI skills I use for my own coursework, with separate roles for course planning, teaching, assessment, research and build review. Course records keep plans, assignments and results across sessions. Grew out of GeminiSensei: I moved from a standalone tutoring app to the learning workflow I actually use.

tapwright | Go CLI | Early development — Oct 2026

A Go CLI for managing a local personal Homebrew tap. The first command, inspect, validates a GitHub repository URL offline and prints its owner and name as JSON. Release discovery and formula management are planned.

Animetro | macOS app and web app | AI-built — Nov 2026

Lays out an anime franchise as a metro line in watch order, using live AniList data. Ships as a macOS app through my Homebrew tap and as a plain web app. Built entirely by AI: Claude wrote the code, tests and release workflow, while I directed the features, tested the app and made the decisions.

Selected learning projects

Completed and archived. Project titles link to case studies and technical retrospectives.

GeminiSensei | Tauri / React / Python / FastAPI / LangGraph — Feb 2026

An AI tutoring desktop experiment started for a competition, with LangGraph teacher, reviewer and orchestrator workflows on Gemini. Connecting the frontend and backend, managing persistence and evaluating the full learning workflow shaped my next approach, Faculty.

dotfiles-maintainer | Python / MCP / mem0 / Qdrant — Jan 2026

An MCP server and semantic-memory prototype for recording why I made configuration decisions. Taught me to define tools around recurring needs and weigh their maintenance cost against a simpler workflow, which is why I retired it.

CodeT5+ Model Adaptation | LoRA / 4-bit quantization / Hugging Face — Mar 2024

Notebook experiment fine-tuning CodeT5+ 220M on Python description/code pairs. Model and adapter files are published; no evaluation shows an improvement over the base model, and the retrospective documents the gaps.

XOR First-Principles Network | Python / C++ / C# — Apr 2020

A small neural network written by hand in three languages without an ML framework: forward propagation, backpropagation and momentum updates, with seeded demos and regression checks for each language.

Work experience

Computer Diagnostic & Electric Specialist
Jan 2024 - Present

Nile Garage | Kuwait

- Diagnosed and repaired vehicle electrical and performance faults using computer diagnostic tools, including ECU tuning.
- Used AI assistants alongside diagnostic software to look up fault codes and narrow down causes, diagnosing faults 70% faster.
- Analyzed repair data with simple scripts to spot recurring component failures and plan repairs earlier, reducing vehicle downtime.

CEO & Co-founder
Sep 2022 - Dec 2023

Yonko Global Forwarding Company | Kuwait

- Co-founded and ran a freight forwarding company, writing Python scripts and API integrations that connected our freight tools so a small team could handle the daily workload.
- Automated document processing, route comparison and shipment status notifications for clients, cutting manual work by 50%.
- Built scripts to track customs and compliance requirements for sea and land shipments across several countries.

Logistics Officer
Nov 2021 - May 2022

Khalid Sultan / Natureland | Kuwait

- Wrote Python scripts to automate landed-cost calculations and shipment reports across GCC supply chains, reducing manual data entry errors and saving 8 hours a week of reporting.
- Analyzed shipping data to find recurring cost overruns, supporting rate negotiations with international shipping lines that lowered freight rates by 3-6%.

Purchase Executive / Customs Brokerage Liaison
Nov 2019 - Oct 2021

Afrah Al-Khaleej Co. | Kuwait

- Used scripts to parse procurement data, cutting purchase report time by 50% and speeding up the checking of supplier technical documents.
- Mapped internal purchasing workflows to find bottlenecks, which helped make government regulatory clearances 30% faster.

Tools I've worked with

Languages: Python, TypeScript, Go, C++, C#, Bash

Applications & tooling: FastAPI, React, Tauri, FastMCP, Git, Jujutsu, GitHub Actions, Docker, Linux, Homebrew

AI: Claude Code, agent skills, MCP, LangGraph, LangChain, Gemini API, PyTorch, Hugging Face Transformers

Education

Self-Directed Continuing Education

Relevant Coursework: Mathematics for ML & Data Science Specialization, ML & Deep Learning Specialization

University of Tabriz
Sep 2014 - Jun 2019

B.Sc. Computer Science | GPA: 14.67/20

Certificates

Data Science Math Skills | Duke University — Apr 2024

Languages

Arabic (Native), Persian (Native), English (Fluent)
